Shower Head Cleaning Instructions

Our showers are provided with a filter between hose/inlet and shower that makes it impossible for debris to gather in the shower. When needed, unfasten the hose or inlet, flush and cleanse the filter. This should be done every now and then, especially in calcareous areas. Lime deposits are formed on the outside of the strainer when water is condensed, but never on the inside of the shower. Brush while letting the water flow. Aquiv8 shower strainers are lime repellent and therefore very easy to clean. **Is the shower clogged?** Loosen the retaining screw on the face and put the strainer / face in a weak solution of vinegar for a while. Then reassemble and brush it while letting the water flow (picture 2). Make sure that the air inlet is open. Maximum function is reached only if water and air inlets are open. Our units are quick and easy to clean and do not require the use of aggressive acids or limescale removers. With this in mind **DO NOT** clean units with acid
